DOCKET FILE COPY ORIGINAL

Re: *Ex Parte* Presentation  
ET Docket No. 95-183/RM-8553, PP Docket No. 93-253

Dear Mr. Caton:

Representatives of WAVTrace and WinStar Communications Inc. ("WinStar") met today with Rudolfo L. Baca, Legal Advisor to Commissioner Quello. The scope of the meeting was limited to a discussion of the proposed amendment of the Federal Communications Commission's Rules related to the licensing of spectrum in the 38.6-40.0 GHz ("39 GHz") frequency band, as contained in the Notice of Proposed Rule Making in ET Docket No. 95-183, RM-8553, PP Docket No. 93-253 (released December 15, 1995).

WinStar described its current 39 GHz system, including a description of the equipment it uses under the current rules. Representatives of WAVTrace briefly presented some information describing the technical design and performance characteristics of its point-to-multipoint system designed for use in the 39 GHz band. WAVTrace and WinStar also discussed their positions on the proposed rules under consideration in the pending 39 GHz rulemaking. Specifically, they urged relaxation of the Category A antenna requirement and permitting point-to-multipoint use of the spectrum. The rulemaking positions advocated are summarized in the materials attached hereto, which were left with Mr. Baca and are submitted for inclusion in the record.

In accordance with Rule 1.1206(b), the original and six copies (two for each Docket or Rulemaking number) of this disclosure have been submitted this 3rd day of October to the Office of the Secretary. Questions regarding this matter should be directed to the undersigned.

Sincerely,

Lee J. Tiedrich  
Jennifer A. Johnson

# WVTRANCE

Formerly American Wireless

# Summary

## Modular scalable

supports wide range of capacities  
evolve to cellular fabric  
grow with demand

## Fast simple installation

fast time to commission  
low deployment and life cycle costs

## Supports heterogeneous services

## High spectral efficiency

## Strong foundation architecture

more links higher data rates

# PTM Supports Public Interest

## Affordable Services

PTM addresses the massive demand of potential mobile users for short-range, high-quality, high-capacity radio links.

PTM systems use cellular-like designs to address the unique needs of mobile users that make up the rest of the market.

## Increased Local Access Competition

High costs of fiber installation and wired upgrades have promoted little competition among wired operators, particularly for the small to medium-sized business customer.

PTM offers high-capacity, heterogeneous services for customers and low capital outlays for the service provider.

# Recommendations

Neither specify nor restrict

any protocols

modulation

spectral efficiency

antenna category, or do not require Standard 4 antennas

to be used, or require a specific beamforming or antenna configuration

Permit competition to discover trade-offs and

effectiveness

Coordinate precise locations of all transmitters and receivers

Mitigate interference by allowing 38 GHz licensees to exchange frequencies through streamlined assignment procedures and allow for transmission capacity leasing arrangements

## WINSTAR POSITION ON POINT-TO-MULTIPOINT EQUIPMENT

- WinStar Communications, Inc. is a national local communications company providing broadband communications using its 38 GHz Wireless Fiber<sup>SM</sup> services. WinStar has authority to provide CLEC service in 28 markets, and CAP service in 37 markets. WinStar currently provides switched wireless telephone service in Boston, Los Angeles, New York, Newark, Dallas, Washington, D.C., San Diego, and Chicago. By year 2000, WinStar expects to be providing switched wireless telephone service in over 40 markets.
- Within each city, WinStar will (1) identify target buildings and hub sites, (2) sell to customers in target buildings, (3) connect customers over resold lines, (4) install a Lucent 5ESS switch, (5) build hub sites, and (6) then replace resold lines with Wireless Fiber<sup>SM</sup> connections directly to hub sites which are connected to the switch.
- A key part of WinStar's strategy is to establish hub sites that have line of sight to the target buildings. These hub sites each aggregate telecommunications traffic from dozens of buildings and deliver the traffic to WinStar's local switch in each market. Nationwide, WinStar has targeted 49 initial hubs in its first ten cities. Ten sites have already been constructed, and all 49 hubs are scheduled for completion by the end of the year.
- Because multipoint 38 GHz equipment is not yet available on a commercial scale, WinStar presently employs a multiple point-to-point technology at each of its hub sites using a cage-like structure that holds multiple antennas. Each antenna is individually directed at a particular target building. As more customers are added to the network, more point-to-point antennas are added to cage.
- WinStar is working with equipment vendors to develop second generation 38 GHz antennas that offer a more elegant multiple access solution. As a result, future WinStar hub sites will not require a cage, and will deploy sophisticated, less obtrusive, phased array, flat antennas. Similar technology is also being developed in the DEMS band.
- The provision of point-to-multipoint service by wireless CLECs like WinStar can only serve to further the development of competition in the local telephone market.
- The long-awaited 38 GHz Order provides the appropriate vehicle for the FCC to clarify that the operation of point-to-multipoint equipment in the 38 GHz band is permitted.

Receiving WinStar Service**

### **Does WinStar Limit Our Choice of Telecommunications Providers?**

- NO

WinStar increases your tenants' choice of communications by providing "access" facilities for telecommunications carriers who are trying to service your tenants without having to lay fiber optic cables.

### **Is WinStar Asking Owners to Purchase a Product For Themselves or for the Building?**

- NO

WinStar provides the tenant amenities as outlined in the enclosed materials at no cost to the building owner.

### **Will the Aesthetics of the Building Be Maintained?**

- YES

WinStar installs a small, unobtrusive (12" diameter) millimeter wave dish(es) on the building rooftop (often invisible from the street) and connects the unit to an indoor unit mounted inside a 22-inch telecommunications equipment cabinet in an existing closet or mechanical space via a single coaxial cable.

The installation is quick and simple, and requires no underground construction or right-of-way acquisition. It is equivalent to high capacity fiber links, without digging up streets or sidewalks.
